Observations -
*) The real time is increasing but there is significant increase from 256 to 1024
*) The user time approximately scales almost linearly wrt number of processes but then plateaus
*) Overall there was differences each time I ran vs comparing it running without jobscript that overall I am confident only about a qualitative statement on user time increasing and then plateauing

Number of processes	Real time (s)	User time
4	2.28	0.67
16	2.36	1.69
64	3.20	10.50
256	3.24	10.12
1024	137.82	9.47
